

JavaScript String Methods - Cheat Sheet

length

Returns number of characters in a string.

Example: 'Geeks'.length // 5

charAt(i)

Returns character at index i.

Example: 'Geeks'.charAt(2) = 'e'

substring(i)

Returns substring from index i to end.

Example: 'Geeks'.substring(2) = 'eks'

substring(i, j)

Returns substring from i to j-1.

Example: 'Geeks'.substring(1,4) = 'eek'

concat(str)

Concatenates strings.

Example: 'Hello'.concat('World') = 'HelloWorld'

indexOf(str)

Returns index of first occurrence.

Example: 'Learn Share Learn'.indexOf('Share') = 6

indexOf(str, i)

Search from index i.

Example: 'Learn'.indexOf('a', 2) = 2

JavaScript String Methods - Cheat Sheet

lastIndexOf(str)

Returns last occurrence index.

Example: 'banana'.lastIndexOf('a') = 5

=== / !==

Compares strings for equality.

Example: 'Geeks' === 'Geeks' = true

toLowerCase()

Converts to lowercase.

Example: 'HELLO'.toLowerCase() = 'hello'

toUpperCase()

Converts to uppercase.

Example: 'hello'.toUpperCase() = 'HELLO'

trim()

Removes whitespace from both ends.

Example: ' Geeks '.trim() = 'Geeks'

replace(a, b)

Replaces a with b.

Example: 'foo'.replace('f','b') = 'boo'

includes(str)

Checks if substring exists.

Example: 'hello'.includes('he') = true

JavaScript String Methods - Cheat Sheet

split(delimiter)

Splits string into array.

Example: 'a,b,c'.split(',') = ['a','b','c']
